

FALCON

FLYING DRONE PILOT LOCATOR

MYDEFENCE

FALCON

A flying RF detector capable of detecting drone controller signals to localize the drone pilot. Falcon is designed to identify the drone pilot, making it possible to eliminate the threat, by apprehending the drone pilot.

Falcon is a flying drone and drone controller detector providing the operator information about a controller threat. Falcon is built to localize the pilot flying a drone, making it possible to mitigate the drone threat, by catching the pilot. Prevent both active drone threat and the next threat from occurring.

By gaining extra height, the Falcon will have better line of sight for the controller. When controller is detected, the signal is followed with the falcon flying RF sensor, and the drones camera is used to identify the threat. Falcon makes it easier to search an area for the drone pilot, as you are given the direction of the controllers signal, while having a camera feed from the drone flying the Falcon.
